Technologies:

React, React native, Next.js, Typescript, tailwind, reduxtoolkit, redux-persist, git, REST-API, three.js, GSAP, gradle, notifee, background-actions

Languages: **English(B2)**, Russian, Ukrainian

Education: **Bachelor** in computer-integrated technologies and robotics

Kharkiv Polytechnical Institute, 2019-2023

Applied to master's degree program, 2023-2025

Experience:

Built animated and highly-optimised website using Next.js, gsap and react-three-fiber. I was able to keep commercially important metrics slim and reached a solid page speed among with loading time. Performance scores for each page according to built-in LightHouse analyzing tool are 97/100, 99/100 and 87/100 in a «heaviest» place - 3d object scene with resource-heavy calculations

Created React native app based on REST-api that increased income of short time investments in field of virtual items. Both expoCLI and then nativeCLI were used to achieve an advanced control. Background service uses native module to keep app alive and still to send push-notifications via notifee. Operational data is stored in async-storage linked with redux-persist aside from sensitive data that is kept in encrypted storage to provide safety for SHA-256 authorization keys
